

# AccuVein® AV300

Vein illumination device

- . **Easy to use and transport**
- . **Builds confidence of phlebotomists**
- . **Increases staff productivity and decreases costs**
- . **Designed to be non-contact, no sterilization between uses**

The AccuVein AV300 vein illumination device allows phlebotomists and nurses to quickly and accurately locate donors and patients veins beneath the skin.

#### **In blood centers**

A successful venipuncture is an essential element in ensuring donor satisfaction and a successful blood draw. Deferrals and incomplete blood draws are inefficient and costly to operations.

#### **In hospitals**

Whether drawing blood specimens or establishing IV access, venipuncture is the most commonly performed invasive medical procedure. It is also one that frequently requires additional time and multiple attempts to be successful.

# AccuVein® AV300

Vein illumination device

The AccuVein AV300 works using infrared light technology which is absorbed by hemoglobin in the blood. When the AccuVein is held about 18 cm above the skin, veins appear noticeably different than the surrounding tissue. The vasculature shows up clearly on the skin's surface, aiding in vein location for accurate venipuncture.

## Easy to Use and Transport

The AccuVein AV300 offers a simple point and click design that requires no pre-use calibration or adjustments. The device fits in your hand, weighs only 283 gr and comes with a rechargeable battery that allows for easy use in mobile or fixed site environments. Also the AccuVein AV300 has been designed for non-contact operation.

## Benefits of the AccuVein AV300 in blood centers

- Helps visualize the best vein for each procedure and maximizes efficiency and revenue by minimizing loss of component revenue due to vasculature deferrals and QNS.
- Enhances perception of a positive donation experience for donors by improving vein visualization and donor assessment for a successful first stick (mitigates fear of needles).

## Benefits of the AccuVein AV300 in hospitals

- Increases staff productivity: a missed vein requires the procedure to be repeated; productivity can be further impacted should the phlebotomist have to escalate the procedure to specialized staff.

- Provides more timely treatment/diagnosis: blood tests that facilitate diagnosis and patient management may be delayed because of difficult venipuncture.
- Decreases patient discomfort: patients may endure unnecessary needle sticks.
- Decreases stress for both patients and staff.
- Helps to achieve specific cost reduction in: unnecessary PICC lines, unnecessary use of IV start kits.
- Decreases the risk of infections (catheter related blood infections).
